

1

Inputs

Traffic network

Historical traffic states

Sensor budget & candidate nodes

2

Recoverability-Driven
Bilevel OptimizationUpper
level

Choose sensor layout z
(subset of candidate nodes,
 $|z| = \text{budget } k$)

Lower
level

Reconstruct hidden traffic
states x using a
transparent GLS/MAP
estimator

Objective components

Reconstruction
errorPosterior
uncertainty

Tail risk

Spatial
redundancy penalty

Deterministic solver /
exchange refinement

3

Selected layout &
evaluation

Selected sensor layout

● Selected sensor

Held-out reconstruction
evaluation

Metric:
GLS/MAP MAE

4

Comparison &
claim boundaryPre-registered
non-BiOpt baselinesCurrent-best
comparison

i Baselines are used only
for held-out comparison,
not inside the solver.

Output: a recoverability-aware sensor deployment with
lower held-out hidden-state reconstruction error.
